

# Knob (Potentiometer)

- use a breadboard for connecting it to your Arduino
- use the **Arduino Serial Monitor** to see the analog input value change when you turn the knob:

## **Sample Code: use with Serial Monitor**

```
/*
AnalogReadSerial
Reads an analog input on pin 0, prints the result to the serial monitor.
Attach the center pin of a potentiometer to pin A0, and the outside pins to +5V and ground.

This example code is in the public domain.
*/
void setup() {
    // the setup routine runs once when you press reset:
    // initialize serial communication at 9600 bits per second:
    Serial.begin(9600);
}

void loop() {
    // the loop routine runs over and over again forever:
    // read the input on analog pin 0:
    int sensorValue = analogRead(A0);
    Serial.println(sensorValue);
    // print out the value you read:
    delay(1);
    // delay in between reads for stability
}
```

## **Sample Code: LED 13 flashes at speed determined by knob position**

Created by David Cuartielles  
modified 30 Aug 2011  
By Tom Igoe

This example code is in the public domain.

```
*/  
  
int sensorPin = A0;          // select the input pin for the potentiometer  
int ledPin = 13;             // select the pin for the LED  
int sensorValue = 0;          // variable to store the value coming from the sensor  
  
void setup() {  
    // declare the ledPin as an OUTPUT:  
    pinMode(ledPin, OUTPUT);  
}  
  
  
void loop() {  
    sensorValue = analogRead(sensorPin);  
    // read the value from the sensor:  
  
    digitalWrite(ledPin, HIGH);  
    // turn the ledPin on  
  
    delay(sensorValue);  
    // stop the program for <sensorValue> milliseconds:  
  
    digitalWrite(ledPin, LOW);  
    // turn the ledPin off:  
  
    delay(sensorValue);  
}
```
